

Quality Management

– Close gaps-in-care and improve your quality metrics

More and more payment plans now depend on meeting certain quality metrics for specific patient populations.

Many of the quality metrics include information that needs to be provided by the patient others depend on the patient taking an active role in their own health.

This means that providers and their care teams are spending more and more time interviewing and informing patients about their health - at the office or on the phone and then manually entering data in to the EMR.

All in all this is a time-consuming process that takes away time from helping the patients or forces the providers to hire more staff.

Qure4u solves this by implementing digital care plans for the patients that drives care plan adherence and data collection from the patient.

The patients get a self-care app that notifies them when they need to come in for check-up or complete a task in their care plan and they can schedule an appointment with a click of a button.

The app gives the patient a better insight in to their care plan and makes it easy for them to provide the information for the quality metrics at home at their convenience.

The care plan is set up for the individual patient depending on age, gender, conditions and payment plans. MIPS requirements are also included.

All data is automatically sent to the EMR or other back-end system.

Follow-ups with patients in their home is easily done with Qure4u's integrated Telehealth and Messaging tools.
