

Telehealth and Secure Messaging

– Optimize care by helping patients from a distance

Many patients' health issues are not one-time events that resolve after an office visit or a procedure, but continue as a problem over time.

The patients need ongoing management, and the short, infrequent office visits are the only points in time that patients typically connect with their providers. Once the patients leave, it becomes difficult for their providers to track their health till the next visit.

With the use of Qure4U's HIPAA compliant communication tools, your patients can now get help while at home:

- Securely connect with patients through video consultations and follow-ups.
- The messaging app makes it quicker and more manageable to carry conversations with your patients, while ensuring the safety of sensitive information.

- For patients that are due for procedures you can send preset messages, which increases care plan adherence.
- Bulk messaging allows you to deliver news and updates to a group of patients.

Implementing the Video feature for staff and providers is fast and easy. The feature can be linked to your calendar to match your current scheduling work flow, and set up appointment times based on available hours.

Our MyCarePlan app for patients gives access to both video and messaging, as well as care plans, appointment scheduling, vitals and our health score.

Patients can now have all of their health information on their mobile device, allowing for simple and quick patient-provider communication.
