

Procedure & Protocol Management

– Automate work flows, collect outcome data, analyze results

Providers and nurses spend too much time before and after procedures collecting patient data, making calls to check up on patients and entering results in to the EMR.

We help you get rid of papers and manual input, reduce outbound phone calls and automate collection of patient reported outcome data.

With Qure4u your patients know exactly what they have to do before and after their procedure - and you will be able to identify patients at risk and efficiently analyze results.

We transform your procedure work flows into digital protocol messages in the Qure4u app - MyCarePlan.

Depending on the patients' condition and individual schedule, the app will collect data by notifying them about upcoming tasks and explaining what they need to do when.

Your forms and questionnaires will be digitalized and presented to the patients according to the protocol schedule. All results are stored as discrete data making it possible for you to analyze and document outcome.

With Qure4u you will know exactly how your patients are doing at all times.

If you want to be alerted about patients that need more attention you can use our Remote Monitoring System that flag patients based on vitals like pain, temperature or even on the way they reply to questionnaires.

If a patient needs extra attention you can use the integrated Telehealth and Messaging tools to communicate with the patients at home.

You set the criteria - we make it work.
